

Cutter Kit

For PX4ie, PX6ie

Installation Guide

Introduction

The PX4ie and PX6ie printers can easily be fitted with an optional cutter, provided the printer is not already fitted with a label-taken sensor. The cutters are almost identical with exception for the width.

The cutter unit is fitted by replacing the front door and the printer hinges, and is connected by a single cable to the DIN-connector on the printer's front.

The cutter is available both as a factory-installed option and as a field installable upgrading kit. It can be installed by the operator.

The cutter is intended to cut through a continuous non-adhesive paper strip or the backing paper between labels. The cutter is not intended to cut through any kind of adhesive or other soft material.

Caution: Adhesive material can stick to the cutting parts and render the cutter inoperable and possibly damage the electric motor due to overheating.

Adhesive material can stick to the cutting parts and render the cutter inoperable and possibly damage the electric motor due to overheating

The cutter is intended to cut through continuous non-adhesive paper strip or through the backing paper between labels. It must not be used to cut through any kind of adhesive or other soft material, that may stick to the cutting parts and render the cutter inoperable and even damage the electric motor by overheating.

Maximum paper thickness is 175μ (≈ 175 grams/ m^2) for normal paper-based materials.

Minimum practical copy length is 38.1mm (1.5 inches).

The cutter increases the printer's total weight and length as follows:

Printer	Weight	Length
PX4ie	1.0 kg (2.2lbs)	28mm (1.1 inches)
PX6ie	1.65 kg (3.6lbs)	28mm (1.1 inches)

The cutter can be tilted forward in order to facilitate cleaning and paper load.

Warning: The cutting edge will rotate to home position when the power is turned on and when the printer is rebooted. Always keep the cutter unit closed during operation.

Contents

The cutter kit consists the following,

- Cutter unit
- Two hinges with torx wrench

Installing the Cutter Kit

Follow the procedure to physically install the cutter.

Note: *This procedure applies to both the PX4ie and PX6ie Printers. For simplicity, the PX4ie Printer is depicted in the illustrations.*

1. Switch off the power and disconnect the power cord.

Warning: Make sure to turn off the power before beginning to install or remove the cutter unit.

2. Open the printer's front door.
3. Hold the printer firmly and press the front door sideways to the left so as to disengage the hinges.
4. Remove the door completely.

5. Remove the existing two hinges held by four #T10 Torx screw at the bottom of the printer.

6. Replace the hinges with the new ones that came with the cutter unit using the same four #T10 Torx screw.

7. Fit the cutter unit to the vacant hinges. Make sure that the locking plate snaps into the groove of the right-hand hinge and that the angled plate at the bottom of the cutter is inserted under the printer's bottom plate.

8. Fit the cable from the cutter unit into the DIN connector on the printer's front.

9. Tilt the cutter unit upwards until it locks into place. If the cutter does not lock properly, the hinges of the cutter unit may need to be adjusted using a #T10 Torx screwdriver.
10. Plug the printer back in and switch on the power. The cutter will perform an idle cycle in order to occupy its home position.
11. Switch off the power. Tilt down the cutter and route the paper through the cutter unit between the guide plates (also see the User's Guide). Then tilt up the cutter again and lock it in closed position.
12. Check that the printhead is lowered and switch on the power. Now the printer is ready for operation.

Controlling the Cutter

The cutter can be controlled using the printer command languages and the supported printer command languages are,

- Fingerprint
- Direct Protocol (DP)
- Intermec Printer Language (IPL)
- Datamax Printer Language (DPL)
- Zebra Simulator (ZSim)

To learn how the cutter is controlled using the printer languages, refer to the respective command reference manual.

Maintenance and Troubleshooting

This section describes how to maintain and troubleshoot the cutter unit.

Cleaning

Warning: Switch off the power or disconnect the cutter before cleaning. Keep fingers away from cutting parts!

Caution: Isopropyl alcohol is a highly flammable, moderately toxic, and mildly irritating substance.

The cutter mechanism becomes accessible when the cover is opened. The cutter shears will need to be cleaned on a regular basis to ensure optimal cutting performance.

Use isopropyl to clean the cutter. Be careful to not dissolve the cutter lubrication.

Do not force the spring-loaded anvil blade open more than 5-10mm (0.2-0.4 inches), or the spring may be damaged.

Troubleshooting

Use this table to understand and troubleshoot some common errors you may receive and how to fix them.

Error, Probable cause, and Solution

Error Alert	Probable Cause	Solution
Error 1701 "Cutter Jammed"	A cut has been performed but the shear has stopped on its way back to home (bottom) position.	Clean the shears from adhesive residue.
Error 37 "Cutter device not found"	Cutter cable came loose from DIN connector	Reconnect cutter cable connector to DIN connector
Error 1059 "Cutter does not respond"	Cutter cable came loose from DIN connector	Reconnect cutter cable connector to DIN connector
